

Since the Jetson Nano system belongs to the Linux system file, the win system may prompt to format the partition because the partition cannot be recognized. Do not format it at this time! Do not format! Do not format!

1. The system in the U disk needs to use Win32DiskImager to back up the system.
2. Insert the U disk into the computer USB port.
3. Run the Win32DiskImager tool.
4. Enter the backup img (image) file name in the software, select the drive letter of the U disk in "Device", and then select "Read"

Then start backing up the system. As shown below.

5. After waiting for the backup to complete, you can open the download directory to find the jetson_nano_backup.img image file.

(Note:If you use this method, the space occupied by the file after backup is the space occupied by the SD card instead of the space occupied by the original system)
